Assignment 3.1 Creating a Course Portfolio Reflection

There are several new applications I learned to work with for the first time while creating the start of my online portfolio for this class. They are Google Docs, Cute PDF Writer, WinSCP, and Nvu. Google Docs is an application that I will most likely continue to use in the future. It can be used to create documents and share them with people. The owner of the document sets permissions for the documents he or she creates, allowing control over who can view and edit. This is a very effective application that can be used with students for education purposes or, in my case, with fellow Speech-Language Pathology (SLP) colleagues without creating a file that one would have to attach to an email. Google Docs is definitely relevant to this course, which provides information on communication and technology as it relates to teaching and learning.
